(e) Macroevolution

Evolution ~~is~~ in genetic sense is a process which results in change of gene frequencies

1) Macro evolution as a process is related with evolution of a separate gene pool.

2) It is a long process which involves different species.

3) It ~~is~~ leads to certain morphological changes over a long period of time.

4) It leads to modification of taxonomic groups.

5.) Living population and fossils are studied in macro evolution under the head of paleo-anthropology

6.) Minimum ~~limit~~ of result of macro evolution is species formation.

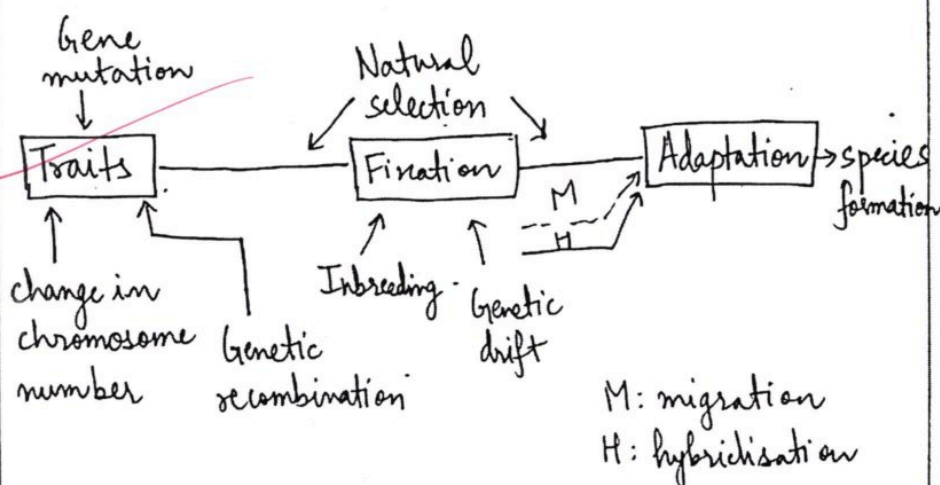

Fig → Evolutionary process

The evolution of Homo erectus to Homo sapiens is an example of macro evolution.
