(c) Differentiate between the anatomical characteristics of man and apes

Man & Apes belong to the
superfamily of Hominoidea.

Skull

- Location of foramen magnum.
- Man doesn't have a well dev Nuchal area to rotate neck.
- Apes have sagittal crest.
- Man has chin but not apes.
- Man has Zygomatic Arch well dev.

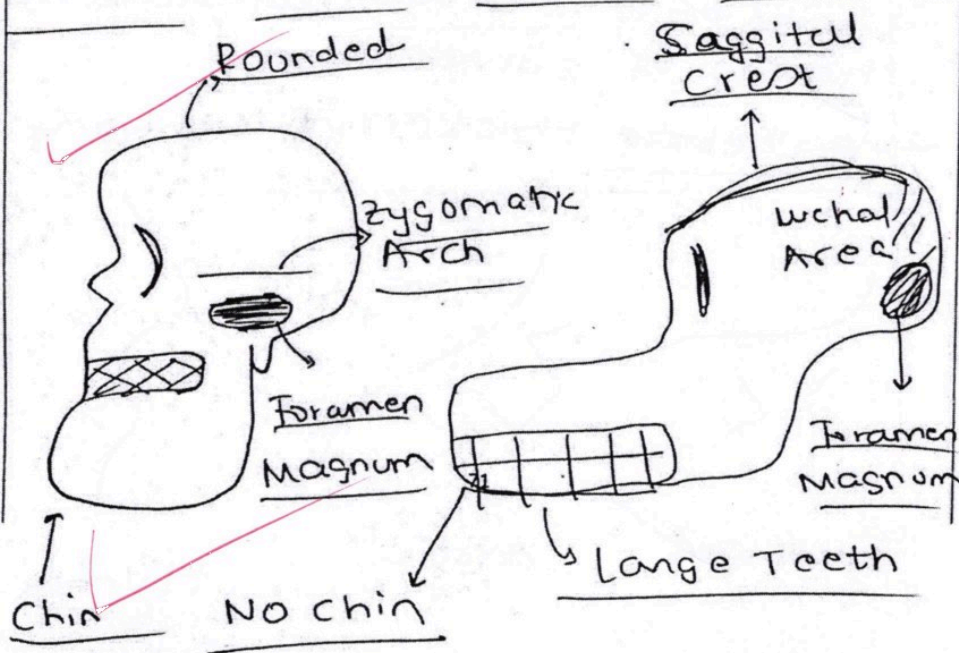

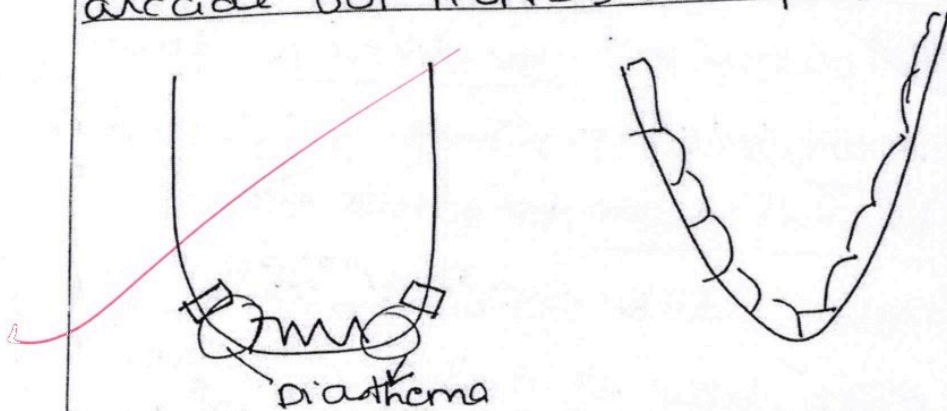

Fig 1

Teeth

- > Diasthema present in Apes; **L2A™** there canines are larger.
- > Apes have U-shaped dental arcade but humans have parabolic

Spinal Cord

Fig: 2

- > Apes have 2 curves whereas humans have 4 curves
- > vertebrae thicker in humans

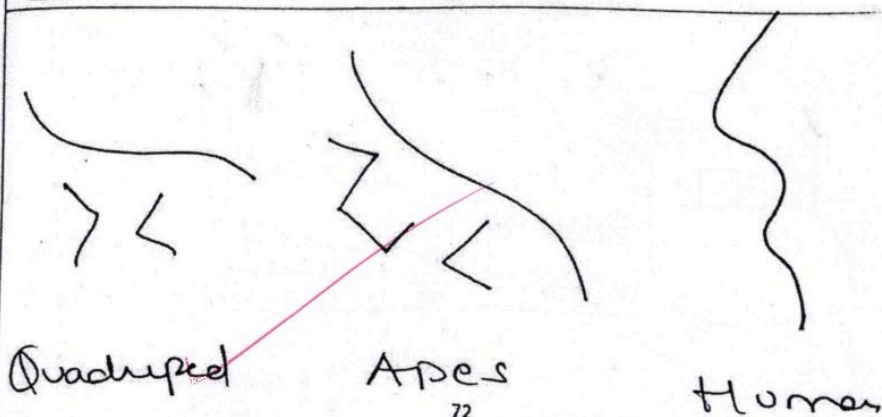

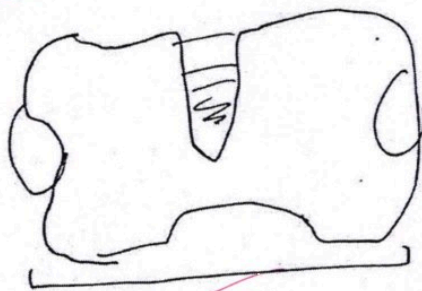

Fig 3

Lower Body

this margin

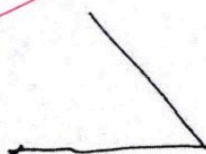

- Pelvis is more basin shaped in man than apes.
- Man has Linea Aspera for bipedalism
- Toe not opposable in man.
- Man has Patella but not ape.
- Knee → Double knee Action in Ma
→ No function in Ape.

Broader

Longer

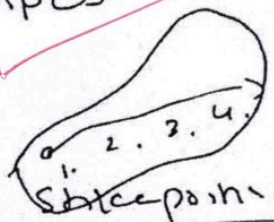

Apes

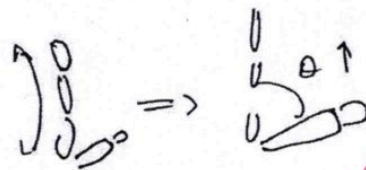

Man

Effect on

Steepest

Apes

Man

Straight phalanges
and thicker thumb
which also longer

Thus most of the anatomical
differences are due to Bipedalism.
