(c) Describe different type of social hierarchies in primates

Primates as per Huxley are the unguiculate,
clavicate organisms with penis, mammary
glands, testes, opposable thumb. etc.

Social Hierarchies in Primates

1) Among primates, the group are often divided into social hierarchies.

2) Often those at top are aggressive in nature and this result in there increased access to natural resources, food and matings with partner of choice.

L2A'''

3) Pusey et al studied Tanzanian National Park and observed that these chimpanzees at top have better access to food and water. He concluded that these groups have increased chances of survival.

4) Often there are infighting among groups regarding dominance $\Rightarrow$ often increased strength and ~~less~~ aggression $\Rightarrow$ results in higher social status.

5) Other factors like age & is also important. Often older in a group are respected more.

Hence a host of factors affects and influences the dynamics of social hierarchies among primates.
