5.c) CRISPR Cas9 technology and its uses

CRISPR Cas9 is the ^{tool in} DNA recombinant technology for finding the gene of interest and cutting it for gene therapy or enzyme production or various genetic research.

The technology involves the process

A	T	G	C

Gene therapy
Can be used for
enzyme production
mRNA vaccine, etc.

The usage of the CRISPR Cas9 is

- ① Use in the CART Cell therapy of the Cancer treatment.
- ② In the Pharmaco-genomics — personalised medicine.
- ③ Analyse the genetic load in the population.
- ④ Helps in Genetic therapy using genetic counselling and screening.
- ⑤ Helps in determining the genetic evolution through Y-chromosome or Mt. DNA diversion rate.

Hence, we can see that CRISPR Cas9 upholds various benefits, but it should not be misused in designer baby or any unethical means.
