(Don't Write
anything in this Area)1.d) Genetic Screening and counselling

Genetic screening refers to the process of identifying the individuals amongst the set of population for their vulnerability to genetic disorders.

While Genetic counselling refers to the medical communication ~~technology~~ procedure of empathetically communicating about genetic disorders & their management.

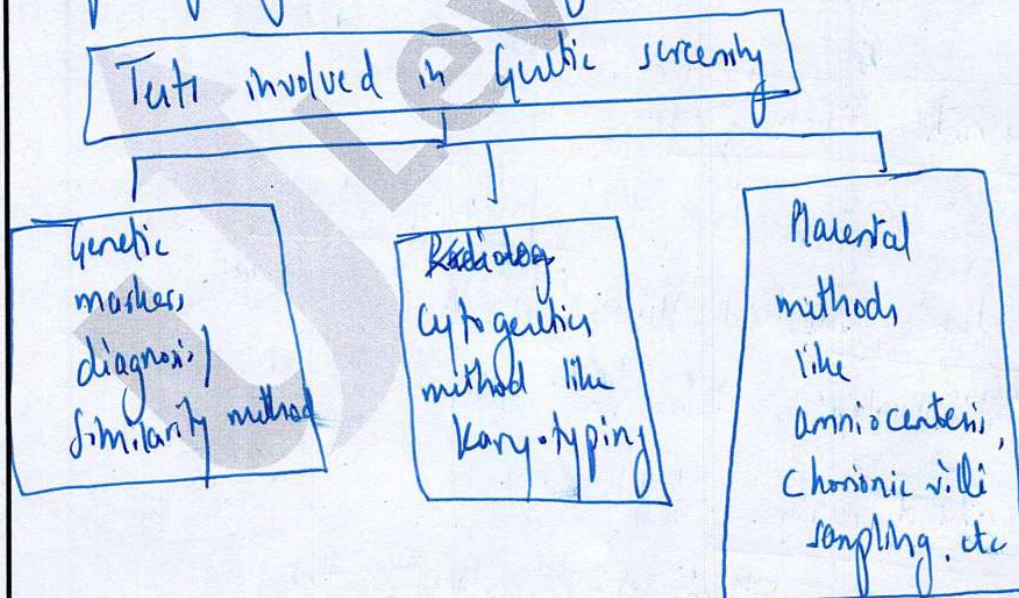

Genetic Counselling

It involves the following steps

- 1) Pedigree / Medical History of the individual or individuals is taken in detail
- 2) Proband analysis is done
- 3) Identify the pattern of inheritance & the probability of genetic disorder happening

- 4) Perform genetic screening - diagnostic tests
- 5) Communicate the cause & consequences to the individuals along with its prognosis, possible course of action & its management
- 6) Follow up based on the need

Therefore, genetic screening can be part & parcel of genetic counselling or can also be done in silo without involving the aspect of genetic counselling.

Hence, both are crucial in management, especially prevention of genetic disorder inheritance & quality of population reducing genetic load.
