5.d) Recombinant DNA Technology and its use

Recombinant DNA technology
refers to the 'combination of DNA
sequences of interest' in order to apply it
across various fields of interest. for various ~~uses~~ ^{uses}

Concept

1) Human production

Uses

1) Agriculture - rDNA is used for production
of various hybrid species with better
resilience & productivity

2) Health - rDNA is used to produce multiple

health products like proteins, antibodies,
enzymes, hormones, etc.

10) Hormonal therapy only Hormonal

3) Energy sector - rDNA is used for
4th generation biofuels like bioethanol,
biomethane only algae

4) Species conservation - rDNA technology
can be used for preventing extinction of
several species

5) Internal security - rDNA can be used
to protect ourself against bioweapons

6) Newer customized medicines
Newer technologies like CART-cell
therapy, etc can be used to produce
customized medicines.

Therefore, the applications are immensely
beneficial to humanity as whole.
