5.d) Childhood and infant stage of human growth

Infant stage usually last for around (0-3) years of age, wherein the child is at the delicate and nascent stage of development.

Biological features

- ① It is Cephalocaudal and proximodistal growth.
- ② Brain develops faster at this stage.
- ③ child height is also increasing rapidly.
- ④ need mother's milk for Igh.
- ⑤ Gene + Environment $\Rightarrow$ Better Cognitive IQ growth.

Cultural feature

- ① Due to Bipedalism, birth canal became narrow, so pre-mature

birth of the human happened
 (2) It needs larger time to learn the skills to develop better.

Childhood stage

It last from (3 - 14/15) years of age. It is generally upto the age of puberty.

Biological changes

- ① Growth rate is decreasing as it is growing towards Adolescent
- ② Develops to walk, talk and visualise properly.

Cultural features

- ① Time/phase of learning social skills that will be utilised in Adolescent stage-
 - ② Due to Complex Society, biologically the child is reaching in Adolescent early but it needs more time to learn social skill → Cultural lag.
- Hence, we can see the Biological & Cultural features in these stages.
