1.c) Differentiate between Fecundity and Fertility

Fecundity refers to the number of offsprings produced by women during her reproductive age or phase of life

While fertility refers to the ability of a human body to conceive a child or not.

Differences

Fertility	Fecundity
1) Fertility is the question of one's biological capacity	1) Fecundity ^{by itself} is not indicative of one's biological capacity
2) A human body can be fertile but not fecundable	2) No fecundity without fertility
3) Not about or related to one's individual choice	3) Matter of individual choice or cultural norms

4) Fertility of a population indicates its reproductive success

4) Fecundity of a population determines its demographic pattern

5) Biological or organic causes might lead to 'infertility' conditions both in male & female

5) It is determined majorly by social factors like level of education, cost of living, etc

Similarities

1) Both fertility & fecundity are measures used in Population / demographic studies

2) Both are crucial indicators of Adaptive success to environment of a given species

3) Both are immensely affected by cultural norms & technology of time.

ex Artificial reproductive technologies

Therefore, they are always relevant to human studies in anthropology
