(Don't Write anything in this Area)

- 2.c) Critically evaluate reason for declining age of menarche in human females over the successive generations. (15 marks)

Menarche refers to the initiation ~~class~~ stage of reproductive age of women i.e. the point where the menstruation ~~cycle~~ cycle begins to occur & women become capable of bearing a child.

Menarche generally occurs at age of 12-14 years of age across human population although the exact age of occurrence differs due to various factors.

Recently, there has been secular trend of declining age of menarche in human females

Reasons for declining age of menarche

- 1) Improved nourishment levels: Successive generations are having better access

& availability of food with modern system of agriculture. It leads to better posterity of girl child

2) Increased fat consumption: It is scientifically proven that the age of menarche depends on the concentration of fat in one's body. i.e. Higher the fat proportion, faster the age of menarche.

3) Dulike in patriarchal mindset: Girl child are now given equal care & protection with ~~these~~ avoidance of earlier discriminatory practices ex ~~the~~ girl & boy child given food together

4) Educational level: Better access to information & awareness about re female body changes has helped in early & smoother transition of puberty.

5) Urbanisation : Anthropological studies have also found correlation between early age of menarche and whether given girl child stays in urban urban or rural centres.

For example, Study by A.M. Tripathi notes that,

UP $\rightarrow$ 13.8 years
Delhi $\rightarrow$ 11.2 years
Calcutta $\rightarrow$ 12.3 years
age of menarche.

Therefore, there is decline in age of menarche across human population indicative of evolution of Human species as whole with changing environment.
