(b) Discuss the Ageing and Senescence and describe the biological and social theories of Ageing

20

Aging implies that a person is getting older in age. irrespective of when it occurs in life span.

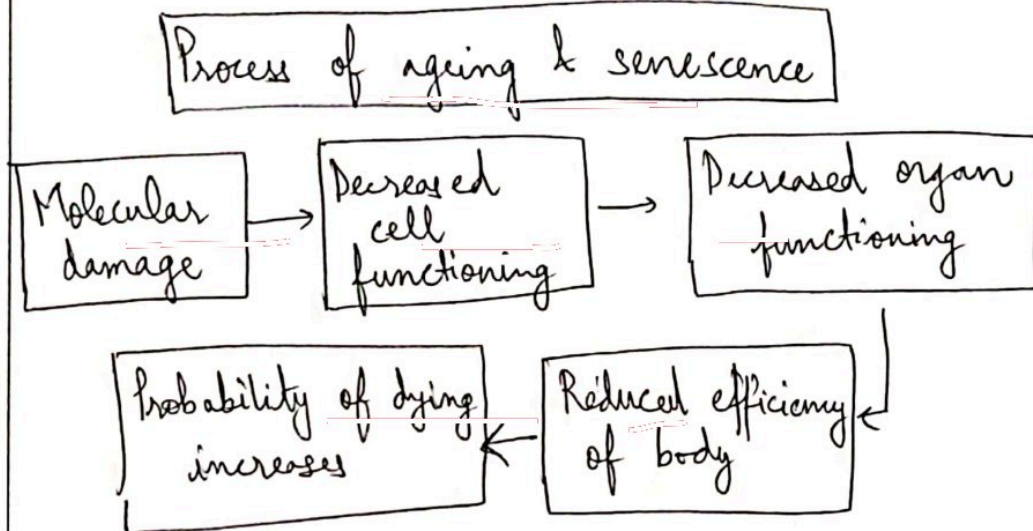

As per Stechler (1970), senescence is the change in post reproductive life particularly characterised by decrease in efficiency due to functional decline.

Effects of ageing
and senescence

- loss in elasticity of skin
- loss in vision, memory
- Reduced brain efficiency
- Decreased heart & lung ~~funct~~ functioning.
- Reduced bone density.

Biological Theories of Ageing

1) Death Gene Theory

- According to it, a certain specific gene programs in such a order that cells begins to die after certain age.

Categorise
theories into

Cellular

Extra cellular

Modern

2) DNA damage repair theory

- A person dies when the cells of the body are unable to repair the damaged DNA.

mention other
theories as
well

telomere
theory of
aging

- similar to Free Radical Theory.

Social Theories of Ageing

1) Disengagement Theory

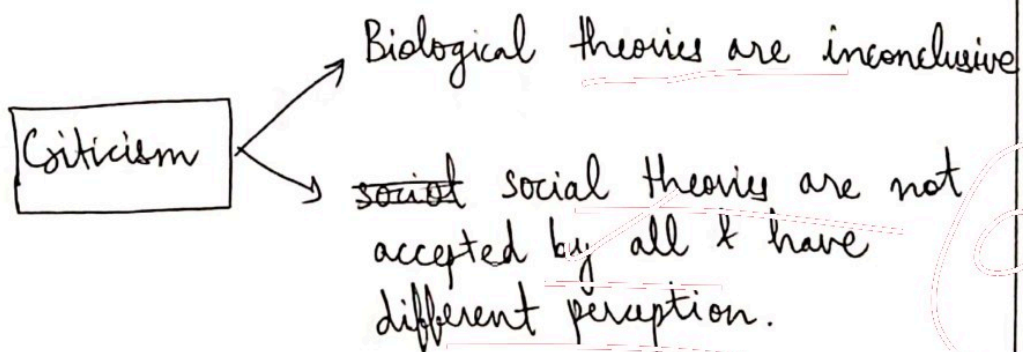

- ageing occurs when a person disengages from all social activities & his presence in society.

2) Continuity Theory

- ~~Age~~ According to this, ageing occurs when a person continues to be present in society as per old strategies.

3) Activity Theory

- In this, a person in ageing tries to remain active in society through various techniques.

Hence, no one single theory can be used to justify ageing the process of ageing.
