(c) Discuss the factors affecting growth in infancy and childhood.

As per Malina growth is the ~~quali~~ quantitative change in the size or parts of body.

Infancy and Childhood are 2 stages of human growth and development.

Factors affecting growth in infancy & childhood:

1) Genetic factors

→ person grows as per genetic factors like sex, twins etc.

81

Heredity is an important genetic factor

also mention about genetic disorders that affect growth

2) Environment factors

Focus on Environment stress and growth

- Emotional stress have a direct bearing on growth of child.

Write this
under
social factors

- Season also affects the growth. Spurt in height is faster in spring & weight in autumn

- Migration also have a bearing on growth.
eg: Japanese migrated to USA experienced more height growth.

Quote the author or source of this statement

3) Hormonal factors

- growth hormone (GH) is responsible for growth in height.

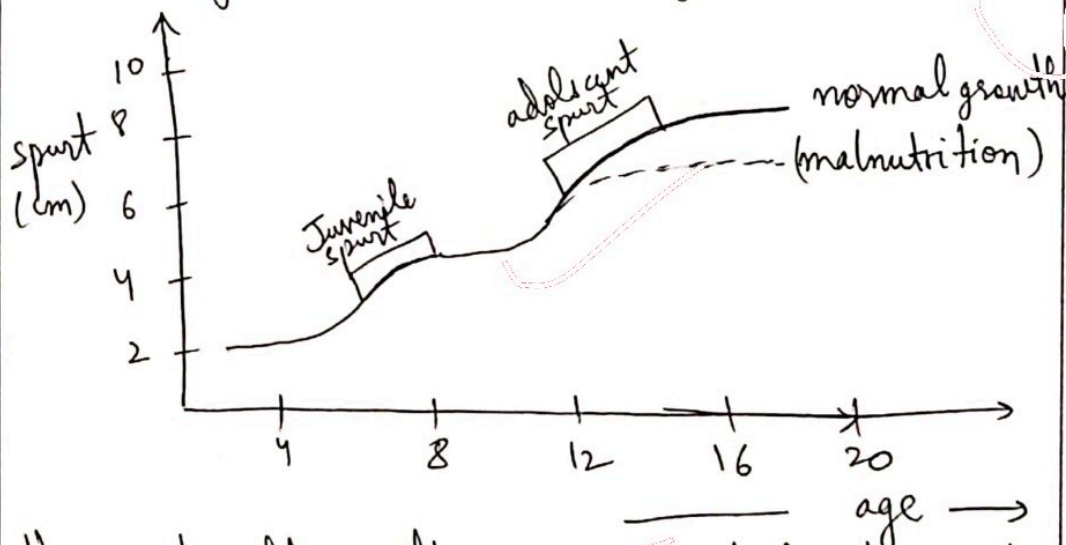

4) Bio-cultural factors

- Economic conditions like poverty may hamper the growth of an infant
(Tanner, 1970)

- Minor illness like measles, cholera may ~~also~~ have an impact on infants.

5) Nutritional factors

- Children aged 0-5 are most vulnerable to malnutrition. It may result in stunting & wasting.
- According to Ministry of Tribal affairs (MOTA) infant mortality rate among tribal regions is 62 against national average of 42.

Hence, to address these government has launched POSHAN abhiyan to ensure proper child growth.
