(d) Cultural and socio-economic factors affecting human growth

As per Malina, growth is the quantitative increase in size.

Human growth is affected by various cultural and socio-economic factors.

1) Nutrition: malnutrition leads to stunting and wasting, hence ~~growth~~ growth is affected.

2) Economic conditions

- As per Tanner (1970), the children of managerial class have had increased growth than that of worker class.

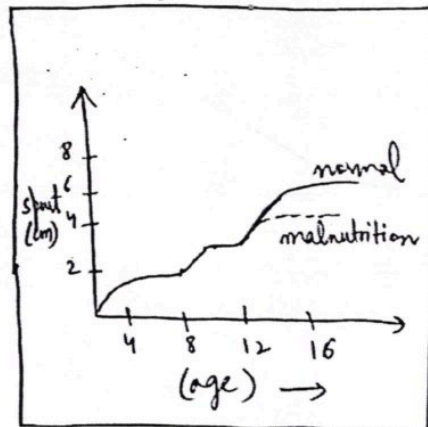

Fig- velocity curve.

3) Sanitation and hygiene also affects growth as they prevents one from bacterial or viral infections.

4) Lifestyle practices.

- increased smoking, drug abuse, alcohol consumption leads to decreased growth due to their effect on various organs of body.

5) Tension, stress and trauma may also inhibit the secretion of growth hormone which affects growth (Tanner)6) Minor illness: like stunting, cholesterol also affects the growth of an individual.

Government of India has launched initiatives like POSHAN ATLAS, National Nutrition Mission, Integrated Child Development to provide proper nutrition to propel growth of child.
