(c) Discuss the biological theories of Ageing

Ageing refers to the phenomenon of growing older.

Biological Theories of Ageing

A) Programmed Theories

- ageing is programmed by a gene
- eg: Death gene theory → there is a gene which is responsible for ageing and which ultimately results in the death of the individual

⇒ Damage Repair Theory

- Ageing results due to ability of body to repair the damaged cells.

- eg: Free Radical Theory

* ageing occurs due to increased presence of free radicals and the inability of the body to repair these damaged cells.

Criticism

- 1) These theories are inconclusive
- 2) No strong evidence backing these theories.
- 3) No general consensus or agreement regarding biological theories.

A study published in Lancet recently
claimed that some of the brain cells
even grow with ageing.

This has even complicated the debate ~~of~~
on the theories of ageing.

Recent COVID-19 phenomenon too has exposed
the vulnerability of the aged population

New researches and projects have come up
with increased funding to look into
factors affecting and responsible for
ageing.
