As per Alfred Sauver, fertility is the actual reproductive performance of a woman.

Relevance of Cultural factors

1) Nutrition

- Access of healthy and nutritious food is important for mother to bear child.
- Due to malnutrition among Saharia tribe of Rajasthan ⇒ high maternal mortality & reduced fertility.
- It decreases the release of certain essential hormones like estrogen.

2) Economic conditions

- poor economic conditions inhibit the release of growth hormones (Tanner, 1970)
- increased stress, tension results in reduced fertility.

3) Age at marriage

- In Kerala, girls usually marry late, this affects fertility as the period between menarche and menopause is reduced.

4) Lack of education & awareness

- poor awareness of family planning and about use of contraceptives affects fertility
- often this results in increased population and unwanted pregnancies.

5) Superstition

- often use of contraceptive methods like condoms and abortions refused as taboo among various tribes.

6) Lifestyle methods

- smoking, alcohol consumption, drug abuse often results in poor reproductive health of women.

With increased urbanisation and industrialisation, pollution levels have also increased. This affects the fetal development & reproductive health of women
