1.c) Demographic Transition Theory

Demographic transition theory means that due to factor of disease, health, genes and nutrition the demography had changed across the time. It takes into the element of fertility.

Stages of the Demographic Transition

- ① High Birth rate & Death Rate: Due to infectious disease and no information of the family planning. (Population growing slowly)
- ② High Birth rate & low death rate :→ Rise of vaccines, medicines, improved. Population was growing rapidly.
- ③ Low Birth rate & low death rate
 - ↳ Rise of Contraceptive, even the natural Calamities
 - ↳ Population policies (eg) Switzerland.

④ Birth rate is equal to Death rate :- stage of stabilizing population.

⑤ Low birth rate and High Birth rate
 ↳ due to Rise of infectious disease
 ↳ Microorganisms developed resistance and started to spread.

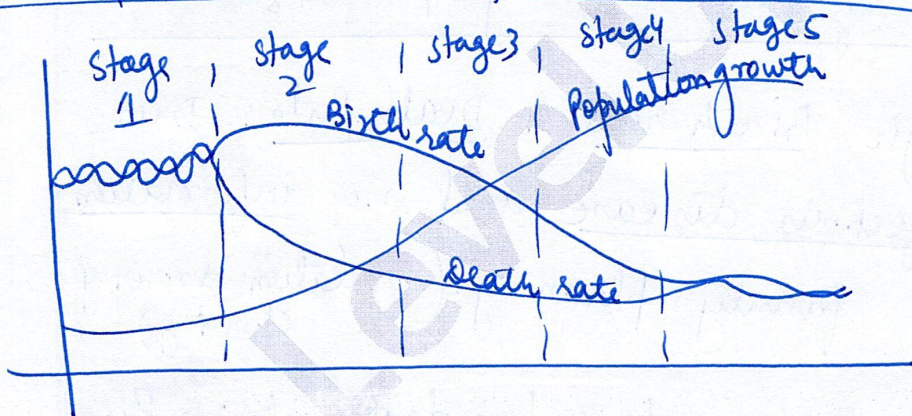

Fig: Population growth: Demographic transition.

Criticism → It did not talk about the time of the stages.

Can't be generalised.

→ Switzerland shifted from stage 1 to stage 3, how?

thus, these demographic transition give us a basic idea of population growth pattern.
