- 6.b) What is meant by epidemiological transition? Elaborate upon its causes and consequences. (15 Marks)

Epidemiological transition means the phase wherein the disease and health condition of the population changes due to various socio-cultural, economic, environmental factors.

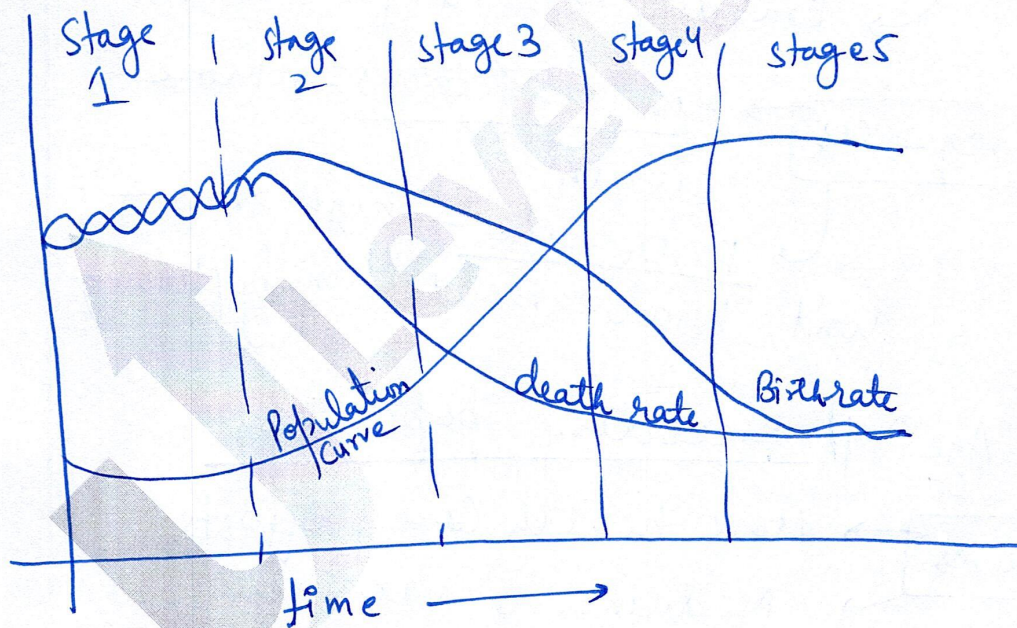

Fig: showing the population transition.

The epimiological transition was

given by Abdul Omren into the following ages:-

① Age of Pestilence and famine

↳ High Birth rate and death rate

Causes → Hunting gathering to farming
→ sedentary lifestyle.
→ breeding ground for microbes

Consequences → More infections → More death.
→ Birth rate → high as we don't know about family planning

② Age of Receding population

Causes → More health care efforts
→ Medicines & Vaccines

Consequences → Birth Rate ↑ (+)
Death rate ↓

↓
Population growth is increasing rapidly.

③ Age of degenerative disease.

Causes → Increase in Non-communicable disease
 → chronic disease like- heart, liver or kidney.

Consequences → Birth rate & death rate ↓
 → longevity increased.
 But organs started to fail.

④ Age of Recurrence of Infectious disease (given by other scholar)

Causes → Microbes are also evolving
 → Microbial Resistance developed.

Consequences → Birth rate ↓ but death rate ↑
 → Pandemics like COVID-19,
 MERS are rising.

Thus, we can see epimiological transition has given the stages of growth but it lacks to provide the specific time when it starts.
