(Don't Write anything in this Area)

- 2.b) What is meant by epidemiological transition? Elaborate upon its causes and consequences highlighting major health problems of our adult population today. (15 marks)

Epidemiological transition refers to the change in health & status & disease pattern of given population with changing dynamics of environment & culture.

Concept

It was given by Abdel Omren, an epidemiological anthropologist. He says that the humanity as a whole has experienced 3 stages of epidemiological transition. Further in 1992, another stage was added by Flansky. Later in 2002, R. Merton added the 5th stage to it.

Phases of epidemiological transition

1) Phase of fertility & famine

- 2) Phase of receding pandemic
- 3) Phase of rise of degenerative diseases
- 4) Delayed degenerative diseases
- 5) Resurgence of infectious diseases

Cause of epidemiological transition

- 1) Change in technology to exploit natural resources

As Neoevolutionists proposed, the technological capacity of given culture determined their economic subsistence method that impacted their superstructure of how they lived

- 2) Settled living: As White called agricultural discovery & practice as Neolithic revolution, & it changed social settlements

3) Urbanisation - It leads to specialisation of labour & increased density of human settlements with reduced physical activity

4) Trade & travel - It led to easy movement of goods, services & people in form of labour and alongside the spread of diseases

5) Healthcare facilities : Modern health has resulted in increased life expectancy of population & in turn, rise of newer diseases like degenerative diseases, etc.

Consequences of epidemiological transitions

1) Rise of life style diseases - Non communicable diseases are leading cause of death Ex Heart attacks

2) Rise of degenerative diseases - Ex Alzheimer's

3) Rise of mental health disorders Ex Schizophrenia

4) Rise of newer zoonotic diseases Ex Covid 19 pandemic

Therefore diseases too are evolving with
