1.b) Janet Carsten's concept of relatedness in Kinship studies

Kinship is the web of social relations by which an individual is related to others by birth/blood/marriage.

[Kinship studies] tend to understand the idea of society using functional/structural approaches because it's the very 'ideom of existence' (E Leach)

[Concept of relatedness]

① Degree to which individual is related to the others

② Kindred → diverse set of relations, far related; hence not a reliable social security in times of need.

but: Filiation (parents with son) is closer association leading to greater security (eg [Filiocentrism in family focused on child])

In lineage systems (eg) Tsembaga [patrilineal exogamous unit] studied by Roy-A. Rappoport, the clan relies on its extended family of 'Mariny' speakers on Papua New Guinea.

Here 'kaika' (pig feast) is performed following planting rumblings into ground, they integrate into new clans.

- Relatedness also speaks of the ability of non lineage kin who can perform functions such as
- ① 'rites de passage' (eg) women goop to father's house for pregnancy
 - ② breaking blood feuds, (dispute solving)
 - ③ no conflict with ego, hence ego protective functions.

Relatedness helps understand kinship as vision of existence.
