1.c) Division of Labour

Division of labour can be traced to pre hominid species such as Neanderthals and primate species (Gorilla) studied by Fossey, making this cultural tool an evolutionary landmark for progress.

Division of labour parameters

① Nature (Prestige of Job)

(eg) Hunting Gathering (Tarawas of Andana)
male-hunter female-gatherer due to
prestige and risk associated.

② Within society

↳ specialisation (eg) woodwork,
blacksmith etc → leading to
civilisational development [formation of
state]

③ Based on environmental conditions

(eg) Eskimos do not distinguish
between men and women during
scarce months.

Functions of DoL / Origin of DoL

① Bio cultural evolution:

Women's pelvis small → small brain/skull of child

non hunts non-women
women-children pair → greater dependence period

② Structural perspective (L.G. Brown on Andamanese)

↳ DoL labour leads to structural continuity and cohesion by creating patrilineal / patriarchal system

Contemporary relevance

① Industrialisation / modernisation - newer institutions (child care centres) → redundancy of dependence → marriage breakdown

(Chicago school Social Breakdown theory)

② Claudia Goldin [U shaped hypothesis] women equally earning as men → hence no strict division of labour exists on sexual differences only on
