

1.b) Ecological Anthropology and Ecosystem approach

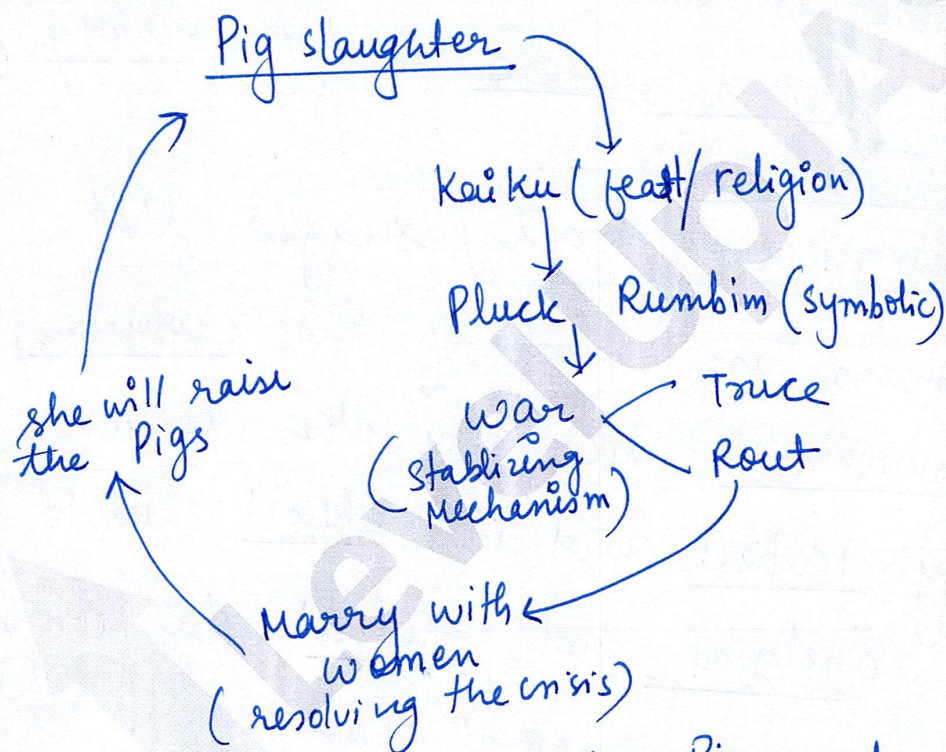

Roy Rappaport gave the ecological anthropology term, it means that there is constant interaction among the Human, Culture and the ecology.

Ecosystem Approach suggest that humans are part of the ecosystem, environment, like any other species. Any impact and its effect has to be analysed and studied by keeping humans as integral part of it.

There is a Cybernetic approach, wherein the ecology tries to maintain the population of the Human under control; so as to subserve

the Carrying Capacity of environment

Example of Roy Rappaport study in Tshembaga

In this example, when the Pigs number increased, it was beyond the Carrying Capacity of environment, Culture reacted with feast, human who were on fast earlier, now eating meat → balancing the entire system.

Thus, we can see how the ecosystem approach and ecology ¹⁴⁶⁵ anthropology is connected.
