Section B

Q.5) Answer the following in about 150 words each:

10x5=50

(a) Sampling Method in Anthropological research

Sampling Method means that a small sample/ replica of larger group is made of whose, the researcher is trying to study.

Types of the Sampling Method

(i) Random sampling: The participants are equally selected in homogeneous society.

(eg) → Mead selected the Samoan girls in the range of (8-20) years.

(ii) Selective sampling: → Every n th element of the research is studied.

(eg) → Government research, NFHS data.

(iii) Cluster Sampling: → It is done where there is clustered population in

the geography. (Eg) → Geertz in the Bali, Indonesia.

(iv) stratified sampling → sample is based on Age, sex, caste and income. (Eg) → Medical anthropologist use in health & disease analysis.

(v) Snowball sampling → one informant, will give the lead of the next participant. It is a chain based sampling.

(Eg) Police uses this in investigating drug mafias & gangs.

(vi) Purposive Sampling → It is taken for doing the specific topic or the matter which is known.

Thus, we can see how the sampling methods are used in various areas.
