

5.e) Genetic Markers and significance of blood group as genetic markers

Genetic markers are the some genetic features of the human body that helps in the identification disease, and health analysis of the human.

Common Genetic markers are :-

- ① Blood Groups - ABO, Rh
- ② HLA System - MHC
- ③ Immunoglobulins
- ④ Transferins.
- ⑤ Haemoglobins.
- ⑥ Gamma factor and marker.

Blood group as a genetic marker

- ① ABO blood group is universal and present in all Human groups

- ② It is permanent and present till our death & even after that.
- ③ Based on Mendelian law of inheritance.
- ④ Can be used in paternity disputes.
- ⑤ It gives a clear cut information without any confusion.
- ⑥ It also gives the information about disease.
 - ⊕ blood group — cholera & sepsis
 - B blood group → pasteural diseases
 - A blood group → Typhoid.
- ⑦ Rh +ve $\begin{matrix} \nearrow \\ \searrow \end{matrix}$ More women fertility
effective against Malaria

Thus, we have seen the genetic marker and blood as the effective anemeli marker.
